

## Non-Operative Labral/FAI Hip Rehabilitation Guideline

This rehabilitation program is designed to return the individual to their activities as quickly and safely as possible. It is designed for rehabilitation following Non Operative Labral/FAI Hip Rehabilitation guideline. Modifications to this guideline may be necessary dependent on physician specific instruction, specific tissue healing timeline, chronicity of injury and other contributing impairments that need to be addressed. This evidence-based Non Operative Labral/FAI Hip Rehabilitation guideline is criterion-based; time frames and visits in each phase will vary depending on many factors including patient demographics, goals, and individual progress. This guideline is designed to progress the individual through rehabilitation to full sport/activity participation. The therapist may modify the program appropriately depending on the individual's goals for activity following Non Operative Labral/FAI Hip Rehabilitation guideline.

This guideline is intended to provide the treating clinician a frame of reference for rehabilitation. It is not intended to substitute clinical judgment regarding the patient's post injury care, based on exam/treatment findings, individual progress, and/or the presence of concomitant injuries or complications. If the clinician should have questions regarding progressions, they should contact the referring physician.

## **General Guidelines/ Precautions:**

- 6-8 weeks of supervised physical therapy
- Avoid exercises or activities that cause either anterior or lateral impingement
- Be aware of low back or SI joint dysfunction
- Pay close attention for any onset of flexor or abductor tendinitis
- Modification of activity with focus on decreasing inflammation takes precedence if tendinitis occurs.
- Patient's with preoperative weakness in proximal hip musculature are at increased risk for postoperative tendinitis

## Non-Operative Labral/FAI Hip Rehabilitation Guideline

Phase	Suggested Interventions	Goals/ Milestones for Progression
Phase I Acute Phase/tissue healing phase	Suggested Treatments: Modalities as indicated: Edema/inflammation controlling pain (i.e. laser) ROM: Passive and AAROM within ROM tolerance Manual Therapy: Hip mobilizations (mobilization in prepositioned extension is a good technique for the labrum, curved gliding)	<ul> <li>Goals of Phase:</li> <li>Diminished pain and inflammation</li> <li>Improved flexibility/range of motion of the hip with flexion and rotations.</li> <li>Proper diagnosis of problem</li> </ul>
Weeks: 2-3 weeks Expected Visits: 1-2x/week	<i>Exercise Examples:</i> <i>ROM:</i> Passive hip circumduction, Active Quadruped rocking, Stool rotations,	Criteria to Advance to Next Phase: 1. Hip motion >75% restored 2. Pain < 3/10 subjectively
	bent knee fallouts, prone hip ER/IR, hip flexor/quads <i>Strength:</i> Isometrics-(clams, fire hydrants, side lying hip abduction, squats, bridge holds, posterior pelvic tilts) <i>Other Activities</i> : bike as appropriate	
Phase II Intermediate Phase/early functional recovery Weeks 2 -3weeks	Suggested Treatments:         Modalities as indicated: Edema/inflammation controlling pain (i.e. laser)         ROM: Passive and AAROM within ROM tolerance         Manual Therapy: Hip mobilizations (mobilization in prepositioned         extension is a good technique for the labrum, curved gliding)         Exercise Examples:	<ul> <li>Goals of Phase:</li> <li>1. Improve muscular strength and endurance</li> <li>2. Progress to full active and passive ROM</li> <li>3. Reestablished dynamic muscle control, balance, and proprioception</li> <li>4. Improve total body proprioception and control</li> </ul>
Expected visits: 2x/week	ROM:         Passive hip circumduction, Active Quadruped rocking, Stool rotations, bent knee fallouts, prone hip ER/IR, hip flexor/quads         Strength:         Planks-front and side         Bird-dogs, quadruped	<ul> <li>Criteria to Advance to Next Phase:</li> <li>1. Full PROM and AROM</li> <li>2. 75-80% abductor strength involved to uninvolved</li> <li>3. Strength adequate to progress to sport specific activity</li> </ul>

	Clam shell repetition	
	Fire hydrants	
	Bridges double →single	
	Cable column rotations	
	Lateral sidestepping with resistive band	
	Step ups	
	Forward step downs	
	Lunges	
	squats	
	Suitcase carries	
	Waiter carries	
	Hip isotonics-Hip extension, abduction, adduction, ER/IR	
	Other Activities:	
Phase III	Specific Instructions: Progress to sport specific activity	Goals of Phase: 1. Advance strength gains with focus on hip abductor and
Advanced	Consider Return to Performance Program (if available), score 45/50	hip flexor strength with appropriate hip strategy
Strengthening/late	Exercise Examples:	<ol> <li>Improve muscular power, speed and agility</li> <li>Progress to sport specific activity</li> </ol>
functional recovery	Sport Specific testing/training (i.e. T-test)	
Weeks 2 weeks		<ul> <li>Criteria to begin running and sport specific activity:</li> <li>1. &gt;90% hip abductor strength for running</li> <li>2. With strength return and muscle coordination, can progress to sport specific activities</li> </ul>
Expected visits: 2x/week
